

Assumptions and clarifications:

I assumed that one client can have multiple emails in the system, but not the other way around. Depending on the future developments of the system, client email might be better designed as an attributes and metadata table as in an EAV model.

I assumed that in the python task, refactoring other functions besides main was also allowed even though it wasn't explicitly stated because as the saying goes, good code should comment itself.

All tables in the ERD schema should have columns: inserted_at, updated_at, inserted_by, updated_by, archived.
